| 18-kn-1040  | 4 CP   | 120 h           | 0 h   | 2               | WiSe                 |
| <b>Language</b><br>German   |  |                 | <b>Module owner</b><br>Prof. Dr. Mario Kupnik |                 |                      |
| <b>1</b>  | <b>Content</b><br>After a safety instruction for electrical equipment, students do lab experiments covering foundations of electrical engineering by using theoretical and experimental instructions to improve basic electrical understanding. Building up a test set autonomously and performing of measurements and evaluations in the form of logs to confirm the theoretical knowledge and lead to independent work in practice.<br>The following experiments are performed: <ul style="list-style-type: none"> <li>• Investigate real behavior of ohmic resistors</li> <li>• Investigate real behavior of capacitors and inductors</li> <li>• Calculate impedances of basic two-terminal circuits using network theory</li> <li>• Measure of electrical power in AC circuits and investigate in the real behaviour of transformers</li> <li>• DC technology, capacity and inductors, AC technology - Impedances and two-terminal circuits, transformer &amp; power;</li> </ul> |                 |   |                 |                      |
| <b>2</b>  | <b>Learning objectives / Learning Outcomes</b><br>After preparing the afternoons independently and self-implementing the measurement setup and measurement tasks by active participation in the practical group and by thorough preparation of the associated measurement protocols, you should be able to: <ul style="list-style-type: none"> <li>• Perform the measurement of basic electrical parameters of DC and AC circuits, independently and in compliance with safety rules</li> <li>• measuring the frequency response of passive electrical networks and resonant circuits, and electric power measurement</li> <li>• the measurement of circuits for the determination of magnetic, electro-thermal and high-frequency. You have to be able to build and run your own measurements</li> <li>• interpretations of the measurement results in terms of its technical meaning, but also their accuracy and error sources safely.</li> </ul>                                 |                 |   |                 |                      |
| <b>3</b>  | <b>Recommended prerequisite for participation</b><br>Parallel attending the lectures and exercises, "Electrical Engineering I and II"  |                 |   |                 |                      |
| <b>4</b>  | <b>Form of examination</b><br>Module Final Examination: <ul style="list-style-type: none"> <li>• Module Examination (Study Achievement, Optional, Standard Grading System)</li> </ul>  |                 |   |                 |                      |
| <b>5</b>  | <b>Grading</b><br>Module Final Examination: <ul style="list-style-type: none"> <li>• Module Examination (Study Achievement, Optional, Weighting: 100 %)</li> </ul>   |                 |   |                 |                      |
| <b>6</b>  | <b>Usability of this module</b><br>BSc ETiT  |                 |   |                 |                      |
| <b>7</b>  | <b>Grade bonus compliant to §25 (2)</b>  |                 |   |                 |                      |

| <b>Language</b><br>German  |   |                          | <b>Module owner</b><br>Prof. Dr.-Ing. Gerd Griepentrog |                      |                              |
| <b>1</b>   | <b>Content</b><br>Electrostatic fields; stationary electrical flow fields; stationary magnetic fields; temporally variable magnetic fields; capacitor networks, transmission lines  |                          |  |                      |                              |
| <b>2</b>   | <b>Learning objectives / Learning Outcomes</b><br>The students have detached themselves from the conception that all electrical procedures are line-bound; they have a clear idea of the field term, can read and interpret field plots and also design simple field plots themselves; they understand the difference between a curl and a divergence field, can describe this difference mathematically and are able to recognize the field type from a mathematical description, respectively; they are able to calculate field distributions for simple rotationally symmetric arrangements analytically; they can deal surely with the definitions of the electrostatic, the electrical quasi-static, the magnetostatic and the magneto-electric field; they have recognized the connection and dualism of electricity and magnetism; they control the mathematical apparatus necessary for their description and can apply it to simple examples; they can calculate with nonlinear magnetic circuits; they can compute inductance, capacity and resistance of simple geometrical arrangements and understand them now as physical characteristics of the respective arrangement; they have recognized, how different forms of energy can be transferred into each other and are thereby already able to solve simple scientific engineering problems; they have understood the underlying physical backgrounds for many applications of electrical engineering and are able to describe them mathematically, develop it further in a simple way and apply it to other examples; they are familiar with the system of Maxwell's equations and can transfer them from the integral into the differential form; they have a first idea of the importance of Maxwell's equations for all conceptual formulations of electrical engineering and they understand the propagation of electromagnetic waves in the free space and on transmission lines |                          |  |                      |                              |
| <b>3</b>   | <b>Recommended prerequisite for participation</b><br>Electrical Engineering and Information Technology I  |                          |  |                      |                              |

| <b>1</b>   | <b>Content</b><br>This module addresses the main features of work techniques, studying methods and time management methods. In addition the specificity of interdisciplinary collaboration and individual challenges arising from it are discussed.   |                         |   |                      |                              |
| <b>2</b>   | <b>Learning objectives / Learning Outcomes</b><br>Mentoring enables students to learn, to identify and to train working methods and learning methods. They realize the importance of application of time management methods in learning processes and acquire the ability to implement them target-oriented for enhancement of learning success. Students reflect their own actions in learning processes and receive feed-back from the mentor to gain a higher level of self-competence. After completion of this module students have the ability to optimize time management for learning success, to develop the personal learning style and methods and apply learning methods adequate to the met situation and conditions. Students have the ability to analyse reasons for personal understanding and solve them by means of adequate actions and methods, as well as shape further learning processes autonomously. |                         |   |                      |                              |

| <b>Language</b><br>German                 |   |                          | <b>Module owner</b><br>Prof. Dr. Mario Kupnik |                      |                              |
| <b>1</b>                                  | <p><b>Content</b></p> <p>The module includes theoretical discussion and practical application of the measuring chain in detail on example the electrical variables (current, voltage, impedance, power) and selected non-electrical variables (frequency, time, force, pressure and acceleration).</p> <p>In the lecture the following chapter will be thematically treated measuring signals and measuring equipment (oscilloscope, laboratory testing equipment), static measurement error and disturbance variables (especially temperature), basic measurement circuits, AD conversion principles and filtering, measurement method non-electrical variables and the statistics of measurements (distributions, statist safe tests).</p> <p>The topics of the lecture are discussed in the exercise of the module. Examples are analyzed and their application in measurement scenarios are practiced.</p> <p>The practicum of the module consists of five experiments which are time closely matched in time to the lecture:</p> <ul style="list-style-type: none"> <li>• Measuring of signals in the time range with digital storage oscilloscope, trigger conditions</li> <li>• Measuring of signals in the frequency range with digital storage oscilloscope, error of measurement (aliasing / subsampling, leakage) and window functions</li> <li>• Measuring of mechanical dimensions with suitable primary sensors, sensor electronics / amplifier circuits</li> <li>• computer-based measuring</li> <li>• Importing of sensor signals, whose processing and the resulting automated control of a process using a programmable logic controller (PLC)</li> </ul> |                          |   |                      |                              |
| <b>2</b>                                  | <p><b>Learning objectives / Learning Outcomes</b></p> <p>The students know the structure of the measuring chain and the specific properties of the corresponding elements. They know the structure of electronic measuring instruments and basic measuring circuits for electrical and selected non-electrical variables and can apply them. They know the basics of capturing, processing, transferring and storage of measurement data and can describe error sources and quantifying their influences.</p> <p>In the practicum, the students deepen the basis of the measurements with the oscilloscope, the understanding of the relationship between time and frequency range. Methodically they are able to document and evaluate the data during laboratory measuring.</p>   |                          |   |                      |                              |

| <b>1</b>   | <b>Content</b><br>This module addresses the different branches of biomedical engineering. Contents of lab experiments cover current topics of biomedical engineering like medical robotics, measuring and sensor technology, biomechanics, radiotherapy, imaging techniques, biosignal-monitoring, gerontology or Lab-on-a-Chip.  |  |   |                                       |                              |
| <b>2</b>   | <b>Learning objectives / Learning Outcomes</b><br>After successful completion of this module students will be familiar with practical applications of medical engineering and have learnt to identify necessary practical methods and work techniques and to implement them correctly. They will also have gained experience in experimental works in autonomous small groups from a medical engineering context. |  |   |                                       |                              |

| German                                    |  |   | Prof. Dr. Ralf Riedel |                 |                      |
| <b>1</b>                                  | <b>Content</b>   |   |                       |                 |                      |
|   | <p>In this module, the fundamentals of materials science and engineering are taught. Particular focus is on the structure, mechanical and surface properties of metals ceramics and polymers and how these properties determine the behaviour as an implant material under mechanical and corrosive load.</p> <p>The following topics will be discussed:</p> <ul style="list-style-type: none"> <li>-Chemical bonding and structure of materials,</li> <li>-classes of material (metals, ceramics, glasses, polymers, semiconductors, and compo-site materials),</li> <li>-mechanical properties of materials,</li> <li>-polymeric, metallic and ceramic materials in medical technology.</li> </ul> |   |                       |                 |                      |
| <b>2</b>                                  | <b>Learning objectives / Learning Outcomes</b>   |   |                       |                 |                      |
|   | The students know and understand chemical bonding in materials and the resulting structural and functional properties. They are able to apply and analyze the structure property relations of metallic, ceramic and polymeric materials. Students can evaluate the properties of materials in biomedical engineering.  |   |                       |                 |                      |

## 4 Medical Fundamentals

|   |  |                          |  |                      |                              |
|---|--|--------------------------|--|----------------------|------------------------------|
| <b>Module name</b><br>Terminology, Medical Morphology and Applied Anatomy |  |                          |  |                      |                              |
| <b>Module Nr.</b><br>18-mt-1010   | <b>Credit Points</b><br>6 CP   | <b>Workload</b><br>180 h | <b>Self study</b><br>60 h                    | <b>Duration</b><br>2 | <b>Cycle offered</b><br>WiSe |
| <b>Language</b><br>German   |  |                          | <b>Module owner</b><br>Prof. Dr. Thomas Vogl |                      |                              |
| <b>1</b>  | <b>Content</b><br>The module deals with the fundamentals of the morphology of the human body, its tissue structures and their relationships. In particular, human organs are discussed in their microscopic and macroscopic anatomy including the sensory systems, the musculoskeletal system, the cardiovascular system, the digestive system, the nervous system and the stomatognathic system. This includes the knowledge transfer of medical and dental terminology. Anatomical structures and functional relationships are explained on the basis of common clinical cases and thus the direct reference to the clinic is established. At the same time, the module discusses methods and devices that can be used to represent the anatomy and functions of the body, such as medical imaging. In addition, the participants gain initial knowledge about the organizational structures of diagnostic processes. On the basis of a discussion of medical methods and theoretical approaches in surgical disciplines, the participant learns central medical problems. |                          |  |                      |                              |
| <b>2</b>  | <b>Learning objectives / Learning Outcomes</b><br>After successfully completing the module, the students understand the basics of medical terminology and can tap into the most important and common medical terms. They are familiar with the fundamentals of the microscopic and macroscopic anatomy of important body systems and have acquired a deeper understanding of common medical problems, especially in the fields of surgery, internal medicine and dentistry. They know various media for obtaining information about the morphology of the body and can assess their differential diagnostic reliability. In addition, the students are familiar with important clinical pictures, can explain them in diagnostics and therapy as an example and discuss them with medical professionals and as well as with laypersons.  |                          |  |                      |                              |

| <b>Module Nr.</b><br>18-mt-1020   | <b>Credit Points</b><br>6 CP  | <b>Workload</b><br>180 h | <b>Self study</b><br>0 h                        | <b>Duration</b><br>2 | <b>Cycle offered</b><br>WiSe |
| <b>Language</b><br>German   |   |                          | <b>Module owner</b><br>Prof. Dr. Ingrid Fleming |                      |                              |
| <b>1</b>  | <b>Content</b><br>This module deals with medical biological fundamentals, which are the basis for the application of engineering methods to living systems in biology, medicine and dentistry. In addition to the fundamentals of terminology, cell biology, chemistry and genetics, basic knowledge about chemical and biochemical procedures and processes are also conveyed. Hereon building up, the participants gain insight into first physiological processes within the human body and their relationships. Physiological and exemplary pathophysiological functional relationships are explained on the basis of common clinical pictures and thus the direct clinical reference is established. At the same time, the participants gain their first knowledge of diagnostic procedures in medicine and dentistry and get an overview of the organizational structures of diagnostic processes. On the basis of discussion of medical methods and theoretical approaches in conservative or metabolically-related disciplines, the participants learn key medical questions. |                          |   |                      |                              |
| <b>2</b>  | <b>Learning objectives / Learning Outcomes</b><br>Students who have successfully completed this module can understand the biological, biochemical and physiological context and apply it to the development and evaluation of biomedical diagnostic and therapeutic systems. In addition, the students, having understood cell and molecular biological processes acquired in this module, will be prepared to discuss medical content with medical professionals and laymen and to understand the basic biomedical literature. They know various media for gathering information about metabolic processes in the body and can assess their reliability.   |                          |   |                      |                              |

| <b>1</b>  | <b>Content</b><br>This module deals with the basics of biomechanics. Basis for this is the anatomy of the musculoskeletal system. Among these is integrated the introduction into rigid bodies, multi-body models of human body parts, different modeling variants or the determination of the reaction forces and moments in human joints. In addition, this module deals with material sciences for considering the human body and with materials that are used in particular in medical technology. These include medical-grade materials used to make implants that remain temporarily or permanently in the body, as well as biomaterials used to replace body tissues (skin, bones, cartilage, etc.). In the areas of biomechanics and biomaterials, the basics of osteosynthesis techniques with implants and endoprosthetics are presented as well as basic principles of tissue engineering in the fields of medicine and dentistry. |                          |                           |                      |                              |
| <b>2</b>  | <b>Learning objectives / Learning Outcomes</b><br>After successfully completing this module, students gain knowledge and understanding of the biomechanical basis of human body functions. They shall be able to independently and critically use biomechanical methods. Students are familiar with the basic materials and their mechanical and biological properties used in the human body. In particular, students are familiar with the requirement profile for material behavior regarding medical engineering. They are able to independently select materials for an application from medical engineering, to assess their advantages and disadvantages and to explain them in an argumentative manner.   |                          |                           |                      |                              |

| <b>1</b>                                     | <b>Content</b><br>Biomedical engineering supports medicine with technical solutions in the areas of prevention, diagnostics and therapy. This module focuses on applications in the fields of anesthesiology, internal medicine, neurology and dentistry. Punctually, other disciplines complement the program. In particular, current research and development projects in the field of device technology are presented, taking into account the underlying biotechnology. In addition, anatomy and functional processes in the human body are presented and discussed in the context of common clinical pictures. By this, the transfer of scientific questions from a fundamental area and theory into real clinical application will be illustrated by practical examples. Methods and devices with which the anatomy and functions of the body can be represented, are in a particular focus. One core area is the understanding and application of medical imaging and image processing such as segmentation, filtering and image reconstruction. The use and importance of different devices and methods are presented in a problem-oriented manner. This includes the use of interventional procedures that includes invasive patient treatment by imaging support. The second core area is presentation and application of intracorporeal sensory and actuarial systems detecting and affecting body functions minimal invasively. |                          |                          |                      |                              |
| <b>2</b>                                     | <b>Learning objectives / Learning Outcomes</b><br>After successful completion of the module, the students gained insights into the implementation and application of medical devices and biotechnological procedures. They are informed about the current R & D-status of medical device technologies and special biotechnology. In addition, they can independently apply their acquired knowledge to interdisciplinary questions in medicine and engineering and thus express a position related to a specific field.   |                          |                          |                      |                              |

| <b>1</b>   | <b>Content</b><br>In small groups, students have the opportunity to participate in the everyday clinical practice of various medical disciplines and to experience the use of medical devices in daily use as well as to experience the possibilities and limitations of the device technologies. They participate in various everyday clinical situations in a hospital and learn the clinical communication channels, workflows and treatment strategies.                            |   |                     |                           |                      |
| <b>2</b>   | <b>Learning objectives / Learning Outcomes</b><br>Students know the day-to-day work of a physician and the communication structures of a hospital. They understand the terminology and “language” of a medical doctor and can communicate with them sufficiently. They are familiar with a wide range of applications of medical devices and products and are informed about the current state of development of medical devices.  |   |                     |                           |                      |
| <b>3</b>   | <b>Recommended prerequisite for participation</b><br>Recommended are „ Terminology, Medical Morphology and Applied Anatomy“ and „ Natural Scientific Principles for Medical Engineering“ und „Biomedical Engineering“. As well as being vaccinated against measles, mumps, varicella, tetanus and hepatitis B according to the recommendation of the Standing Committee on Vaccinations.   |   |                     |                           |                      |
| <b>4</b>   | <b>Form of examination</b><br>Module Final Examination:<br><ul style="list-style-type: none"> <li>Module Examination (Technical Examination, Report, Pass/Fail Grading System)</li> </ul> Module final exam:<br>*Module exam (Technical examination, Presentation, pass/fail grading system)<br>After course II the examinee compiles a two-page summary of a medical device, describing functional principle and possible applications but also its limitations in the medical field. |   |                     |                           |                      |

| German                                    |  |                 |                     |                 |                      |
| <b>1</b>                                  | <b>Content</b><br>This module deals with the legal foundations of the (inter-) national health system and the medical law (among these the medical drug law (AMG), the medical device law (MPG), the transplantation law (TPG)) and practical aspects, e. g. in forensic medicine. It will also cover the basics of medical ethics and bioethics, which will give a closer look to the ethical aspects of research on humans and the development of medical technologies in a legal-ethical context. |                 |                     |                 |                      |
| <b>2</b>                                  | <b>Learning objectives / Learning Outcomes</b><br>Upon successful completion of this module, students are sensitized to legal issues, current case law and ethical aspects in medical engineering and (bio) medicine, including actual and future research projects. They can derive scientifically based judgments that take into account social, legal, scientific, ethical and practical knowledge.   |                 |                     |                 |                      |

| <b>1</b>   | <b>Content</b><br>In this lab tutorial, an introduction to the software tool MatLab/Simulink will be given. The lab is split into two parts. First the fundamentals of programming in Matlab are introduced and their application to different problems is trained. In addition, an introduction to the Control System Toolbox will be given. In the second part, the knowledge gained in the first part is applied to solve a control engineering specific problem with the software tools. |  |   |                           |                                   |
| <b>2</b>   | <b>Learning objectives / Learning Outcomes</b><br>Fundamentals in the handling of Matlab/Simulink and the application to control engineering tasks.  |  |   |                           |                                   |

| <b>Language</b><br>German          |   |                                    | <b>Module owner</b><br>Prof. Dr. rer. nat. Florian Steinke |                           |                              |
| <b>1</b>                           | <b>Content</b><br>The lab covers the following basic software development skills: <ul style="list-style-type: none"> <li>• working together and software development in teams</li> <li>• lightweight software engineering process eXtreme Programming (XP)</li> <li>• training of advanced OO/Java programming skills and coding standards</li> <li>• software documentation using JavaDoc</li> <li>• the basics of the development tool eclipse</li> <li>• regression testing methods (test framework JUnit) to increase software quality</li> <li>• more sophisticated data structures and algorithms</li> </ul>                                |                                    |  |                           |                              |
| <b>2</b>                           | <b>Learning objectives / Learning Outcomes</b><br>Students participating in the lab deepen their basic programming knowledge (acquired in Computer Science for Engineers). The focus is on development of “medium-size” software in contrast to programming small toy examples, working in teams and evolution of existing software (framework). Afterwards students are expected to be able to develop small software systems using a "light-weight" software development process. Furthermore, they will appreciate training in more sophisticated software engineering techniques needed for the development of "real-world" software systems. |                                    |  |                           |                              |

| <b>1</b>  | <b>Content</b><br><p>The lecture gives an introduction to the broad discipline of software engineering. All major topics of the field - as entitled e.g. by the IEEE's "Guide to the Software Engineering Body of Knowledge" - get addressed in the indicated depth. Main emphasis is laid upon requirements elicitation techniques (software analysis) and the design of software architectures (software design). UML (2.0) is introduced and used throughout the course as the favored modeling language. This requires the attendees to have a sound knowledge of at least one object-oriented programming language (preferably Java).</p> <p>During the exercises, a running example (embedded software in a technical gadget or device) is utilized and a team-based elaboration of the tasks is encouraged. Exercises cover tasks like the elicitation of requirements, definition of a design and eventually the implementation of executable (proof-of-concept) code.</p> |   |   |                         |                              |
| <b>2</b>  | <b>Learning objectives / Learning Outcomes</b><br><p>This lecture aims to introduce basic software engineering techniques - with recourse to a set of best-practice approaches from the engineering of software systems - in a practice-oriented style and with the help of one running example.</p> <p>After attending the lecture students should be able to uncover, collect and document essential requirements with respect to a software system in a systematic manner using a model-driven/centric approach. Furthermore, at the end of the course a variety of means to acquiring insight into a software system's design (architecture) should be at the student's disposal.</p>  |   |   |                         |                              |

| <b>1</b>                                    | <b>Content</b><br>The six-day programming lab is divided into two sections.<br>In the first four days, the programming languages C and C++ are taught with practical tasks and lectures. All covered aspects are extensively practiced under supervision. Based on the fundamental basics of C++, manual memory management and dynamic data structures are handled from a procedural as well as from an object-oriented perspective. Object orientation with C++ is extensively addressed by treating multiple inheritance, polymorphism and parametric polymorphism.<br>The last two days are dedicated to microcontroller programming in C including the opportunity of programming of a distributed application (via a CAN-bus). |   |   |                           |                              |
| <b>2</b>                                    | <b>Learning objectives / Learning Outcomes</b><br>During the lab, the students acquire a fundamental understanding of the programming languages C and C++ with emphasis not only on procedural but also on object-oriented characteristics. The students gain hands-on experience with applying C++ and discover the challenges of using C++ safely and properly especially in the context of embedded system software development.   |   |   |                           |                              |

|          |  |
|----------|--|
|          | After successfully attending the course, students are familiar with the fundamental concepts of information management. They understand the techniques for realizing information management systems and can apply the models, algorithms and languages to independently use and (partially) implement information management systems that fulfill the given requirements. They are able to evaluate such systems in a number of quality metrics. |
| <b>3</b> | <b>Recommended prerequisite for participation</b><br>Recommended:<br>Participation of lecture „Funktionale und Objektorientierte Programmierkonzepte“ and „Algorithmen und Datenstrukturen“, respective according knowledge.   |

| <b>1</b>  | <b>Content</b><br>Overview of Net-Centric Computing (NCC), a basic element of modern computer science. Fundamental network concepts of modeling, planning and evaluating net-centric systems<br>- Foundations: Service, protocols, connection, layer model<br>- protocol mechanisms for media access, routing, broad-/multicast<br>- Multimedia Data Handling<br>- Aspects of continuous data streams and their processing<br>- Quality of service: definition and mechanisms<br>- Multimedia - Synchronisation: Basics<br>- Compression procedures;  |                 |   |                 |                      |
| <b>2</b>  | <b>Learning objectives / Learning Outcomes</b><br>- Overview knowledge of relevant areas and basic problems of net-centric computing (NCC)<br>- Reproducible comprehension of selected, elementary algorithms, protocols and procedures used in the internet<br>- Applicable methodological knowledge of widely applied elements of the modeling and engineering of NCC-systems<br>NCC is, in this context, understood as "internet technology in the broadcast sense". It covers, in particular, themes of the "classical areas" constituted by computer networks, distributed systems, multimedia and mobile communication/ mobile computing, as those from "modern areas", such as ubiquitous/pervasive computing, peer-to-peer-computing or ambient intelligence. The canonical lecture "Introduction to NCS" focusses on the area of computer networks, the understanding of which is fundamental for all other listed areas; the latter will be the subject matter of advanced lectures in the area of NCS. |                 |   |                 |                      |

| <b>1</b>  | <b>Content</b> <ul style="list-style-type: none"> <li>- introduction to modeling using predicate logic and algebraic concepts</li> <li>- interpretation and faithfulness of formal models</li> <li>- systematic construction of models and making of design decisions</li> <li>- abstraction, refinement, composition, and decomposition of models</li> <li>- syntax and operational semantics of programming languages</li> <li>- elementary proof techniques and their use</li> <li>- introduction to specification languages</li> <li>- syntax and denotational semantics of specification languages</li> <li>- modeling communication and coordination in concurrent systems</li> <li>- taxonomy of system properties</li> </ul>  |                          |   |                      |                                       |
| <b>2</b>  | <b>Learning objectives / Learning Outcomes</b> <p>After successfully participating in this course, students know basic concepts in the areas modeling, specification, and semantics. They are able to use predicate logic and algebraic concepts to formalize given, informally described scenarios. They are able to develop formal models in a systematic fashion, to make necessary design decisions, and to employ informal notation and graphics to facilitate the construction of formal models. They know selected formal specification languages and are able to apply at least one such language. They understand the distinction between the syntax and semantics of formal languages and are able to prove propositions about expressions as well as simple meta-properties about the languages themselves. They are able to formalize basic system requirements as predicates and can assess the faithfulness of such formalizations.</p> |                          |   |                      |                                       |

| <b>1</b>  | <b>Content</b><br>- Technological foundations and trends in micro electronics<br>- Design flows for microelectronic systems<br>- Description of hardware systems<br>- Characteristics of computing systems<br>- Architectural support for parallel execution<br>- Memory systems<br>- Heterogeneous systems-on-chip<br>- On-chip and off-chip communication structures<br>- Embedded systems, including in context of cyber-physical systems   |                          |   |                      |                                       |
| <b>2</b>  | <b>Learning objectives / Learning Outcomes</b><br>After successfully attending the course, students are familiar with functional and non-functional requirements for heterogeneous discrete and integrated computing systems. They understand the techniques for realizing such systems and can use design methods and tools to apply the techniques to independently implement computing systems (or components thereof) that fulfill the given requirements. They are able to evaluate computing systems in a number of quality metrics. |                          |   |                      |                                       |
| <b>3</b>  | <b>Recommended prerequisite for participation</b><br>Recommended:<br>Pass of lecture „Digitaltechnik“ and „Rechnerorganisation“, respectively according knowledge.   |                          |   |                      |                                       |
