

Maximum-Likelihood Estimation of Beat Signal Parameters in Automotive Radar

TECHNISCHE
UNIVERSITÄT
DARMSTADT

Bachelor thesis or Master thesis

Topics: sensor array processing, automotive radar signal processing, maximum-likelihood estimation

Description

Conventional FMCW radar systems operate across coarse Doppler and range bins to estimate target parameters, which can be inaccurate for targets with similar range-Doppler-azimuth signatures. Leveraging the sparsity of beat signals in the time-frequency-beamspace representation of the measurement data, we present a sequential algorithm for jointly estimating the polynomial coefficients and azimuth directions of multiple beat signals.[1], [2], [3], [4]

Familiarity with the following topics can be beneficial

- Linear algebra
- Python, Latex

The thesis and presentation will be in English. The supervision can be in German or English.

Please contact Kaleb Debre (✉ kaleb.debre@tu-darmstadt.de), if you are interested.
